OCTAGRAM AI & SOFTWARE SOLUTIONS

Prepared for SweafEx · Whooosh Networks Pvt Ltd

FUTURE PLANNING & BUDGETING GUIDE

SweafEx | Mobile App Options

Future Development Pathways, Delivery Timelines & Estimated Investments for Mobile Transport Operations

OPTION A

Progressive Web App (PWA)

2 Weeks Delivery — ₹50,000

OPTION B

Dedicated Android App

4 Weeks Delivery — ₹1,00,000

OPTION C

Dedicated Android + iOS Apps

6 Weeks Delivery — ₹2,00,000

Exploring the next stage of mobile access: All estimates are tentative for planning and budgeting. They depend upon the completed core web application backend and APIs being ready for direct reuse.

OPERATIONAL MOBILITY & PRACTICAL VALUE

Why Consider a Mobile Solution?

PHASE
Future Extension

Evaluating how handheld access can streamline day-to-day coordination across internal teams, field drivers, and clients.

01 Internal Operations Staff

DESKLESS COORDINATION

- **Away-from-desk management:** View live trip status, vehicle placements, and urgent alerts without being tied to a laptop.
- **Faster approvals:** Review vendor spot rates, approve vehicle indents, and handle exceptions directly from mobile.
- **Reduced phone dependency:** Operational data is accessible immediately without calling back-office colleagues.

02 Field Drivers & Vendors

ZERO-FRICTION UPDATES

- **Simplified trip assignment:** Drivers access pickup addresses, contact numbers, and delivery instructions instantly.
- **One-touch milestone reporting:** Report Arrival, Loading, Transit, and Unloading with single taps.
- **Immediate POD capture:** Photograph and upload Proof of Delivery receipts at the delivery dock, speeding up billing cycles.

03 Shippers & Clients

SELF-SERVE VISIBILITY

- **On-demand shipment tracking:** Clients inspect live trip progress and vehicle coordinates without chasing via phone calls.
- **Instant document access:** View e-way bills, vehicle documents, and verified POD copies as soon as they are uploaded.
- **Professional customer experience:** Reinforces SweafEx's reputation as a digitally enabled freight partner.

Strategic Purpose of This Brief

The objective of this presentation is to help SweafEx leadership compare possible technical models for future budgeting. This is **not a recommendation for immediate spend**; mobile applications are best evaluated once actual web usage patterns are observed.

MANDATORY PREREQUISITE

All mobile options assume that the core web software, backend database, and APIs are 100% completed and verified first.

PLATFORM ARCHITECTURE COMPARISON

Comparing the Three Mobile Options

Side-by-side analysis of delivery timelines, estimated investment, technical approach, and ideal business use cases.

ESTIMATES
Tentative Planning

OPTION A — Web-Powered

₹50,000 — 2 Weeks Delivery

Progressive Web App (PWA)

WHAT IT IS
An enhanced, mobile-responsive edition of the web portal that users can save to their home screen as an app icon.

MAIN ADVANTAGE
Most economical route; directly leverages existing web screens, business logic, and security rules with minimal duplicate coding.

BEST SUITED FOR
Users who primarily need straightforward access to trip details, status milestone updates, and camera POD uploads.

OPTION B — Native App (Android)

₹1,00,000 — 4 Weeks Delivery

Dedicated Android App

WHAT IT IS
A standalone Android application (.apk) installed on devices, communicating directly with the core web platform APIs.

MAIN ADVANTAGE
A tailored native touch experience with mobile-specific navigation, device permission handling, and app-store distribution.

BEST SUITED FOR
Organisations wanting a dedicated Android interface for field drivers, fleet supervisors, and on-the-move operations staff.

OPTION C — Dual Native Platforms

₹2,00,000 — 6 Weeks Delivery

Dedicated Android + iOS Apps

WHAT IT IS
Dedicated mobile applications built for both Google Android and Apple iOS ecosystems, connecting to the shared backend.

MAIN ADVANTAGE
Comprehensive cross-platform coverage, ensuring seamless adoption whether stakeholders use Android phones or Apple iPhones.

BEST SUITED FOR
Enterprises requiring unified app-store presence for high-value corporate clients, directors, and external cargo owners.

⚠ **ESSENTIAL PLANNING NOTICE**

All figures are **tentative planning estimates** based on reusing the backend, APIs, authentication, and role logic from the web application. *The PWA is not inferior—it provides high utility for low cost; dedicated apps are chosen when platform-specific distribution and touch UX are mandatory.*

ENGINEERING BREAKDOWN & SCOPE EFFORT

What Work Is Involved in Each Option?

Understanding the development effort, platform dependencies, and architectural logic that drive the timeline and cost differences.

ENGINEERING SCOPE
Effort Analysis

PWA Engineering

2 Wks · ₹50k

- **Workflow review:** Audit completed web app to identify mobile-essential driver & staff flows.
- **Mobile UI refinement:** Optimize responsive layouts, touch targets, forms, and mobile menus.
- **PWA manifest & service worker:** Configure home-screen install banners, icons, and asset caching.
- **Core testing:** Verify authentication, role limits, trip updates, and mobile browser camera uploads.
- **Deployment & handover:** Direct production push with zero app-store delays.

Key Focus: Refines and adapts existing web frontend without developing a secondary codebase.

Android App Engineering

4 Wks · ₹1,00,000

- **Dedicated mobile screens:** Design & build mobile-native UI components and tab-based navigation.
- **REST API integration:** Connect mobile application securely to existing backend data endpoints.
- **Operational workflows:** Implement role-based login, live trip tracking cards, and direct camera POD upload.
- **Hardware & network handling:** Manage device permissions, connectivity interruptions, and loading states.
- **Device testing & release build:** Test on representative Android screen sizes and compile production APK/AAB.

Key Focus: Builds a standalone mobile client while consuming backend business logic and databases.

Dual App Engineering

6 Wks · ₹2,00,000

- **Cross-platform architecture:** Plan unified codebase delivering native ergonomics on both operating systems.
- **Dual UI implementation:** Adapt layouts for Material (Android) and Cupertino (iOS) navigation conventions.
- **Shared backend integration:** Secure endpoint consumption across both mobile ecosystems.
- **Dual-ecosystem QA:** Extensive verification across various Android hardware and Apple iOS devices.
- **Store release preparation:** Package production binaries and assist with Google Play & Apple App Store submission.

Key Focus: Full two-ecosystem support, device matrix testing, and compliance with dual store guidelines.

PRICING LOGIC

PWA (₹50,000): Low cost because it refines and reuses the existing web frontend codebase directly.

Android (₹1,00,000): Moderate cost because it requires constructing a separate mobile UI and native device layer.

Android + iOS (₹2,00,000): Higher cost due to dual operating system validation, Apple compliance, and dual store overhead.

GOVERNANCE & SCOPE BOUNDARIES

Assumptions, Dependencies & Exclusions

A clear framework of technical prerequisites, third-party items, and commercial boundaries governing all mobile options.

ARCHITECTURE
Technical Governance

✓ Core Engineering Assumptions

- ✓ **Web software complete:** The primary SweafEx web application is 100% developed, tested, and operational before mobile development initiates.
- ✓ **Backend & API readiness:** Required database models, API endpoints, authentication mechanisms, and user roles already exist and are reusable.
- ✓ **Codebase structure:** Existing business logic and backend services are sufficiently structured to support external mobile queries without rewrite.
- ✓ **Agreed mobile scope:** Development is strictly focused on the agreed mobile operational workflows (trip viewing, milestone reporting, POD upload).

✕ Excluded Unless Agreed Separately

- ✕ **New backend features:** Creation of unbuilt server workflows, complex ERP modules, or major changes to core business logic.
- ✕ **Core software redesigns:** Major structural overhauls or visual redesigns of the foundational web application.
- ✕ **Hosting & third-party APIs:** Cloud server hosting, WhatsApp Business API credits, Google Maps API usage, or SMS gateway fees.
- ✕ **App store fees & maintenance:** Google Play Developer ($25 one-time) and Apple Developer Program ($99/year) accounts, and ongoing app maintenance.

⚠ ARCHITECTURAL REVIEW NOTICE

These timelines and prices assume high backend reusability. The definitive scope, final cost, and delivery schedule can only be confirmed after the web software is complete and Octagram has conducted a formal architectural code review. Should additional server endpoints or refactoring be required, revised estimates will be agreed upon with SweafEx before work commences.

NEXT STEPS & ROADMAP

Plan Now. Decide When You're Ready.

A sensible, low-risk roadmap to evaluate your real-world mobile needs before committing capital.

STRATEGY
Next Phase

OPTION A	OPTION B	OPTION C
Progressive Web App	**Dedicated Android App**	**Android + iOS Apps**
₹50,000	₹1,00,000	₹2,00,000
2 Weeks Delivery	4 Weeks Delivery	6 Weeks Delivery

RECOMMENDED 4-STEP DECISION FRAMEWORK

STEP 1
Complete Web System

Finish the core SweafEx web platform, establishing rock-solid operational databases, booking flows, and billing workflows.

STEP 2
Observe Field Usage

Evaluate real-world driver adoption and customer requests through the browser to identify where mobile friction actually exists.

STEP 3
Architecture Review

Octagram and SweafEx conduct a technical review of backend APIs to confirm reusability and validate exact requirements.

STEP 4
Targeted Build

Select the right mobile path (PWA, Android, or Dual) based on validated demand, with precise scope and guaranteed pricing.

★ *"Once the core web software is complete, **Octagram will review the existing architecture with SweafEx** and provide a precise scope, timeline, and quotation for the selected option—ensuring zero wasted investment."*
